

Participant	Preference	Justification	Differences	Suggestion	Hyggard: Hardest (and Why)	Hyggard: Most Useful (and Why)	Hyggard: Least Used	Hyggard: Most Used	MADR: Hardest (and Why)	MADR: Most Useful (and Why)	MADR: Least Used	MADR: Most Used
Participant 01	No preference	I thought both fulfil their role equally.	I believe the decision result and the drivers present in MADR.	No. MADR is a bit redundant and Hyggard is faster and simpler to fill out. I believe if Hyggard had the 'considered options' and who made the decision, it would become richer without getting too much complexity.	No.	Both were simple and intuitive. Why? Context, as it is an important exercise of imagination.	Nothing in particular.	The applied knowledge.	None.	At any case, why Decision results. Because all decisions have some result, which is often ignored.	Nothing specific.	Thinking about the decision results.
Participant 02	Hyggard	It was leaner and straight to the point, but one thing I liked about MADR was that it has a section considering other alternatives before getting which was chosen.	The drivers and the options considered are the most striking differences, perhaps with time, it would be interesting to have this documented, as well as those involved in the decision.	No.	There wasn't a difficult field to understand.	Consequences, Why? Because it allows seeing what the deciders considered when implementing.	It is so lean that it feels like I'm forgetting something.	It is simple and direct and allows for a clearer description.	Decision Result and Pros & Cons, as it seems to become subjective.	Considered options, Why? Because if we ever need to change that decision, we have guidance on which options to reconsider.	If seems redundant and the descriptions can become subjective.	After filling it out, it doesn't give a feeling of emptiness or forgetfulness.
Participant 03	Hyggard	Seems simpler and more objective.	MADR has many more variables and seemed more ambiguous.	No.	Title.	Consequences, it is very direct and very obvious.	Nothing specific.	I liked the objectivity of this model.	Context.	Decision Drivers, shows what was considered to take that decision.	I found it very ambiguous.	Nothing.
Participant 04	Hyggard	I thought Hyggard was faster and more objective. MADR has more fields, allowing greater clarity on what should be present in each. Hyggard bothered me by concentrating a large amount of information in the 'Context' field.	Hyggard has fewer spaces and less direction, but it's faster to fill out. MADR, on the other hand, has more optional fields and is better divided, which makes it more time-consuming, but more objective.	Needs more direction, more restrictions. In the title, for example, it should be clear what elements it needs to possess.	I believe the context, because there wasn't much restriction on how I would answer.	The title, as it already introduced the whole decision.	I felt too loose regarding what I could answer; I wanted more direction/nstructions.	It was faster.	The context box, because I had to summarize. But I liked the decision more.	The title, since it summarized what I needed to know.	There is a lot here that could be discarded. For example, the 'optional' fields.	The division and direction it gives.
Participant 05	MADR	MADR has more fields, allowing greater clarity on what should be present in each. Hyggard bothered me by concentrating a large amount of information in the 'Context' field.	Quantity of Fields and Clarity on what each represents.	I believe MADR is ideal for me, and if I were to alter one, it would be Hyggard to make it more similar to MADR's 'Decision Drivers'.	Context, because many things fit there, such as possible decision options to be taken.	Consequences, it is important to know how a decision reflects on the project.	Filling out the Context.	Being able to fill it out more quickly.	I believe all fields had the same degree of clarity for me.	Decision Result: In ongoing projects, it is important that all participants entering the project know the justification.	I believe nothing bothered me greatly.	Clarity in filling out the fields.
Participant 06	Hyggard	I found it simpler and straight to the point of the problem. MADR seemed to give me more options to document details I considered relevant to justify the decision, and with easier-to-identify fields.	Hyggard.	No. no.	Title.	The consequences, to focus directly on the problems.	Nothing.	Context.	Decision Drivers.	Consequences, to focus directly on the problems.	Many steps.	It is very complete.
Participant 07	MADR	I believe it was the one I used the most and that created ease of use. However, this model demonstrates clarity and ease of use.	The 'Decision Drivers' was the most striking, as being able to justify the decision taker with more details and clarity is important.	Hyggard is succinct and fast, but lacks clarity/justification. It should have a field similar to MADR's 'Decision Drivers'.	None were very difficult, but the 'Decision' was a bit complicated not to mix with the context.	Consequences, to try to demonstrate the 'why' of that decision.	Writing the decision, as it left me a bit afraid of being redundant with the context.	It is a fast and direct model, very easy to do and simplified.	The decision drivers, as it is a field that can end up being redundant with the pros and cons if not well defined.	The decision drivers, for the possibility to better justify what led to the decision-making.	A model with many options that can end up reducing the speed of writing it.	The possibility to express well the motivations and line of ideas that led to that decision.
Participant 08	MADR		MADR proved to be more objective. Hyggard has only the most important information, while MADR has greater details about those involved in the decision and the options raised.	No.	Consequences? Why? I believe due to the large and vast possibility of answers in some cases.	Decision, as it reveals what was chosen to solve the problem.	Lack of definitions.	Compact.	Difficult to think and choose the most important.	Considered optional? Why? Explains the reason for the decision well.	Many options to fill.	Explains clearly the reason and what was taken into consideration to make that decision.
Participant 09	Hyggard	It is much simpler and goes straight to the point, besides being easy to understand.	Hyggard seems to be simpler and more objective to describe the architectural decision and makes it easier to understand the decision.	I believe some steps like context and declaration and considered options are redundant in the MADR model.	Context, as it is a section with a lot of information.	Consequences.	Not having some details that might be important the the options raised.	The simplicity in important information.	Context and Declaration, as I had difficulty not repeating information and sounding redundant.	Considered Options, as it gives a view of how the decision went.	There are many topics and some seem repeated.	It displays details that guide the reader about the team's line of thought or the time of choice.
Participant 10	Hyggard	Hyggard seems to be simpler and more objective to describe the architectural decision and makes it easier to understand the decision.	MADR has many more fields to describe. It is also necessary to describe the evaluated options and a justification.	I think if Hyggard had the history of evaluated options and MADR didn't have the drivers, only the context, it would make both models better.	I think there is no field that was difficult to comprehend in this model.	The consequences, as it shows the positive and negative points of the decision that was taken.	The fact that there is no preview of decisions makes it a bit incomplete, in my opinion.	The simplicity and objectivity to describe the decision.	Writing about the drivers, because I had to think a little about what were the advantages.	The justification part, since it leaves very little room for the reasons why the decision was taken.	The drivers part, because it is a bit difficult to think technically about the advantages of the decision taken.	The options that were considered. They show what possibilities the development team had to solve the problem.
Participant 11	Hyggard	I found Hyggard more 'straight to the point', it brings the important points and leaves the decision taken very clear.	Due to the larger number of information about the architectural decision, MADR explains better the 'why' of the decision.	Adding a field for 'If the chosen option could not be implemented for some reason, what would be chosen?'.	Lifting the positive and negative consequences.	Context, it is always important to know the environment well before solving the problem.	Nothing displeased me.	Definitely the contrast between context/consequences.	Decision Drivers, because it is a little complicated for me to define the standards that the application should identify both.	The Context. It will dictate how the problem will be resolved and the requirements for that.	Having to give positive and negative points for each of the choices.	The drivers.
Participant 12	MADR	MADR, despite being longer and more laborious, manages to document in a more complete way the entire path until taking a specific decision.	The number of existing topics in each model.	The possibility of Hyggard being less vague in the decision information.	The context. Because it was difficult to fill out about a scenario.	The consequences, because it covers well why the decision was taken.	Little detail.	More objective.	Decision Result. Because it shows in fact the justification of the choice.	Considered Options. Because it demonstrates that the team analyzed not just one, but other solutions to give the problem.	Can be a little confusing.	Well detailed.
Participant 13	MADR		MADR asks for much more things compared to Hyggard.	Hyggard could ask for a few more things.	The decision, because I had to explain with a lot of technically the reason for the choice.	Decision and consequences, because it is what holds what we decided to do and what happened from that.	It is very short.	I don't need to detail the other considered decisions so much.	The drivers. Why? Because all other options also had great advantages.	Decision Result. Because it is where we can see how the decision impacted things.	Many optional fields.	It is very complete and with rich information.
Participant 14	Hyggard	I found it simpler and much more objective.	The simplicity, in the day-to-day I would prefer Hyggard.	The Hyggard model should also have a field for us to speak the reason for the choice.	None.	Context, because it explains well what the experiment proposed.	I didn't dislike anything.	Filling out the documentation.	Drivers, I think it confuses a little with the context. I think it would be better if it came after the considered options.	Decision Result, because we can analyze the final result of the experiment.	Nothing.	Nothing.
Participant 15	Hyggard	Clearer and more objective.	No suggestions.	Shuts, because I couldn't identify the functionality.	Context, because it explains well what the experiment proposed.	Shuts.	Context.	Filling out the documentation.	Decision Drivers, because it encompasses various questions.	Decision Result.	Decision Result.	Nothing.
Participant 16	MADR	MADR was the model that best used the organizational drivers, with a more complex structure and schema.	Hyggard is more direct and easier to use, unlike MADR which is more structured and schematized.	I believe both are equally meeting what is asked in ADRs.	The context, seeing that it has to be like the total introduction of the problem.	The decision, as it shows in detail what we hope to find.	It can be something too 'summarized'.	The considered options, seeing that we have to encompass all possible choices.	Decision Result, because we can analyze the final result of the experiment.	The decision result, as it is where we will show the message of what we want for the system.	Nothing.	The MADR model is extremely organized and intuitive.
Participant 17	MADR		MADR demands more details and has more topics than Hyggard.	I believe both are decent and they have their particularities, small projects I would use Hyggard, larger projects MADR.	Consequences, because you have to think about the whole team and the consequences of that decision.	Consequences, precisely for already covering all the people who will be affected by that decision.	I felt I was writing little.	I liked it for being very objective and not demanding many details of the decision.	Decision Drivers, because I could already answer the pros and cons of the options.	Decision Result for showing which decision was taken and its reason for that.	Many questions and requirements for details.	I had to think a bit more not to be redundant in my answer.
Participant 18	No preference	Both have their pros and cons.	Considered Options.	Being honest, both are great.	For me everything was clear.	Context, understanding the base of the problem is fundamental to move forward.	Some information ends up being open.	Ease of the model.	Decision Drivers, because I could already answer the pros and cons of the options.	Decision Drivers, having a margin of what is needed helps more in the decision.	Very extensive.	Certain things became optional and the Decision Drivers facilitate the work development.
Participant 19	MADR	It seems that with it you can pass more of the context of what was happening at the moment regarding the project.	MADR seems more complete, giving a better overall of what was established for the project.	No suggestions.	None, it was very easy to understand.	The consequences field, it dictates the future of the project.	I found it very summarized.	It is very straight to the point, facilitating faster documentation.	It was very calm to understand the parts of the model.	The decision result, it shows the future of the project and the paths of the chosen decision.	I thought it was good and complete, I felt more firmness when documenting.	
Participant 20	Hyggard	I found it more objective than the previous one.	Both models could have an additional space (optional) for some event out of the ordinary.	I think none, they were all very clear.	The consequences, as it shows exactly the pros and cons of the decision.	Nothing, I really liked it, clear and succinct.	The fact that it is more direct than MADR.	Where that choice will solve the problem.	Decision drivers, as they show exactly where that choice will solve the problem.	Very detailed, ends up being less practical to use frequently.	Considered options, as it shows other possible paths.	
Participant 21	Hyggard	I thought it was a simpler and direct model focusing on the main point of the issue addressed.	The main difference was the quantity of attributes to complement in each model.	I found both very efficient. I preferred Hyggard for clarity, but MADR explores with more efficiency the other possibilities.	Title, because finding few words that define exactly what will be done can be difficult.	Context. Because this is the main focus of the model.	Thinking of a good title.	The clarity of the decision that will be taken.	Decision drivers, because this is the final objective of the model, to present the change and the why of it.	Where that choice will solve the problem.	The high quantity of fields to complete.	The Considered Options list, which can be very useful in real project development.
Participant 22	MADR	I found the model clearer and more detailed about the decisions.	The size of the models and their applications.	No.	The decision, because I didn't find it very comprehensible.	The consequences, it helps in decision making.	The Context.	The positive and negative consequences.	Decision drivers, because you need to have good knowledge when filling it out.	Considered options, because we have various choices to take into consideration.	Nothing, I liked everything.	Its simple ways to take a final decision.
Participant 23	MADR	I liked the MADR model more because I felt more comfortable saying the reason for that choice.	I think it is crucial to document the options that were considered.	Pros and cons in MADR could be mandatory.	The decision, because we don't put the other options, and I feel like I am explaining a choice but we only had that choice.	Consequences, in this field we show even to those who don't understand the reason for that decision.	I found it very direct.	Faster to do!	Shuts, I didn't understand much what was to be put there.	Considered options, because it shows that they didn't choose just any option.	Pros and cons being optional.	I found the model easier to understand the motivations of the choice.
Participant 24	Hyggard	The greater ease of comprehension of the terms to be filled made me prefer Hyggard, besides being more direct.	I found Hyggard more objective. MADR has a great differential which is being able to visualize the considered options.	Greater objectivity in MADR topics.	Context, for having to know exactly the situation passing through.	Decision, for exposing exactly the technical choice taken.	I found it quite practical, so I don't have something specific.	Objectivity.	Decision drivers, I found it very technical.	Decision Result, for detailing exactly the reason for the choice.	Topics themes not so objective.	Transmission of greater information for those checking later.
Participant 25	Hyggard	I found Hyggard easier to use and in my opinion it synthesizes MADR.	Hyggard is shorter, becoming less rigid than MADR, which I found off.	No.	None.	Context, as it explicitly a scenario that will occur during the application life.	Nothing, I liked it more.	The simplicity to understand and use.	Decision drivers, I found it kind of abstract.	The Result, together with the justification complicity.	Many fields to fill, it is more extensive.	It is good to have a 'script' directing the decision and attempting to think more about it.
Participant 26	MADR	I believe the MADR model is better directed for group work, as it is like a meeting minutes where everything is noted.	The considered options and the pros and cons.	For Hyggard I missed the Decision Drivers.	The decision, because I missed a topic where it was necessary to develop more the motivations that lead to the decision.	Context, as it explicitly a scenario that will occur during the application life.	Being simpler and for me, seems less flexible than MADR.	The development of context.	I think all of it was well detailed, I found it chill to understand.	Decision Drivers, which speak the reason behind it.	Nothing.	Being more flexible and allowing me to write more about the architectural model decision making.
Participant 27	MADR	I thought MADR asks for more details and specifications than Hyggard, this avoids generic instructions.	The 'Decision Drivers' option in the MADR model.	No.	I had no problems understanding.	The context field, as it gives a brief visualization of the problem.	I thought there are some things that remained vague.	The consequences field being more direct, just listing the positive and negative parts.	I had no problems understanding.	The 'Field Decision Drivers', for specifying the reasons the decision was taken.	Many fields with somewhat unnecessary information.	Being able to detail the decision well.
Participant 28	MADR	In the MADR model I felt that the details were very important, like the part of placing the justification.	Hyggard is simpler and direct, whereas MADR is more detailed and with more justifications.	No.	I think the context, because you have to think about the scenario and write concisely and clearly.	The consequences, as I imagine it is the main part when choosing an implementation.	Actually I found it very chill.	Easier to locate what looks for (consequences, etc).	However I didn't understand very well the part of shuts, deciders and shuts.	The context, since it contextualizes the reader for the problem.	I found it difficult to find what I was looking for.	It brings more details about what must be in each field.
Participant 29	Hyggard	Although MADR explains each field better, I found Hyggard more objective.	Hyggard is more objective and succinct, whereas MADR explains better and more detaility about each field demands.	In MADR, in the Decision Result point it says to indicate the chosen option, justify and also speak the positive and negative consequences.	The decision, I was in doubt if I was just to put the decision itself or if I needed to explain the reason for the decision being taken.	The consequences, because it is an important part for the understanding of the advantages and disadvantages of that decision.	The explanation of the fields is too direct, so doubts may arise.	The simplicity and objectivity of the model.	In the decision result part I was in doubt if consequences and the justification of the decision were the same field.	Considered options, Why? Because it speaks the way of the choice.	It is a more complex model.	The presentation of diverse options.
Participant 30	Hyggard	Hyggard is leaner and simpler than the MADR model, which can facilitate understanding for laymen.	MADR is an extended version of Hyggard, in its extras it puts a presentation of other options to be considered.	No.	The two models don't get to be drastically different, but I believe that adding details like the pros and cons of the options not chosen can end up polluting the ADRs.	Context. Why? Because it defines the decision taken.	The lack of presentation of other options.	The decision and its consequences, Why? They are the fields that hold the most important information of the document.	Decision Drivers. Can be something subjective or close to device that every system aims for.	Considered options and Decision Result. Why? The decision result is the field that holds the most relevant information.	Many fields with somewhat unnecessary information.	Presenting the other applicable options to solve the problem seems a great addition.
Participant 31	Hyggard	Hyggard is simpler and fulfills the objective of delivering the information of the decision taken.	Hyggard is simpler and more practical. However, MADR manages to deliver a wider range of information.	No.	I found all very clear and intuitive.	The decision and its consequences, Why? They are the fields that hold the most important information of the document.	There was nothing that displeased me.	It is very simple, practical, objective and intuitive.	All fields are clear and easy to fill.	Considered options and Decision Result. Why? The decision result is the field that holds the most relevant information.	Many fields with somewhat unnecessary information.	Presenting the other applicable options to solve the problem seems a great addition.
